**Trade Weighted Dollar Index (Broad)**<sup>5</sup> The Trade Weighted Dollar Index is an economic instrument used by economies to compare their exchange rate against those of trading partners. Those trading partners that constitute a larger portion of an economy's exports and imports receives a higher index weighting. The trade weighted index is used to make a more complete comparison between one economy's currency and other currencies it interacts with. It's a more comprehensive analysis than comparing two currencies, such as the U.S. dollar and Japanese Yen. Currency's of the index include the Euro Area, Canada, Japan, Mexico, China, United Kingdom, Taiwan, Korea, Singapore, Hong Kong, Malaysia, Brazil, Switzerland, Thailand, Philippines, Australia, Indonesia, India, Israel, Saudi Arabia, Russia, Sweden, Argentina, Venezuela, Chile and Colombia.

**E.C.R.I. U.S. Weekly Leading Indicators Index** Directly addresses concerns about freshness of data forecasters versus existing leading indicators, including the well-known monthly Index of Leading Economic Indicators (LEI), originally developed by ECRI's founder Geoffrey Moore for the U.S. Commerce Department. This index has an average lead of 10 months at business cycle peaks and three months at business cycle troughs - a longer overall lead than LEI. ECRI's approach focuses on an array of the best cyclical indicators, to identify clearly and objectively when a turn in a cycle lies ahead. Unlike econometric models that project from past trends, these cyclical indicators are specifically designed to predict future changes in the direction of the economy. They turn before the economy does - but the focus is on the timing of a change in direction. ECRI uses an array of 19 specialized leading indexes in the context of an "economic cycle cube" covering various sectors and aspects of the economy. Because ECRI uses separate leading indexes to track the various aspects of each economy, they do not need to be re-jiggered every time the economy's performance deviates from standard economic theory.

**Labor Productivity Rate (Output per hour, nonfarm business)**<sup>4</sup> Productivity is a measure of economic efficiency which shows how effectively economic inputs are converted into output. Advances in productivity, that is the ability to produce more with the same or less input, are a significant source of increased potential national income. The U.S. economy has been able to produce more goods and services over time, not by requiring a proportional increase of labor time, but by making production more efficient. Productivity is measured by comparing the amount of goods and services produced with the inputs which were used in production. Labor productivity is the ratio of the output of goods and services to the labor hours devoted to the production of that output.

**Unemployment Rate**<sup>4</sup> U.S. Department of Labor Civilian Unemployment Rate.

**U.S. Treasury Yield Curve**<sup>3</sup> Current interest rates from U.S. Treasury Bills, Notes, and Bonds from 3 months to 30 years.
